

CERTIFICATE

This is to certify that the project titled “Electronics Sales Dashboard” has been successfully completed by Jessica S using Microsoft Excel. This project is an original work carried out as part of academic requirements. It demonstrates practical knowledge of raw data handling, data cleaning, pivot tables, pivot charts, and dashboard creation for sales analysis and visualization.

Project Guide / Faculty: Farheen Sultan Anjum

Department / Institution: BCA / ANUDIP

Date: 24-01-26

ACKNOWLEDGEMENT

I would like to sincerely thank my faculty for their guidance, support, and encouragement throughout the completion of this project. Their continuous feedback helped me understand the practical application of Excel concepts beyond theory. I am also grateful for the opportunity provided to work on this project, which helped me gain hands-on experience in data analysis and dashboard creation using Microsoft Excel.

1. INTRODUCTION

The Electronics Sales Dashboard project is developed using Microsoft Excel with the objective of analyzing and visualizing sales data in a clear and interactive manner. Dashboards help convert large volumes of raw data into meaningful business insights for better decision-making.

2. RAW DATA DESCRIPTION

The raw data sheet contains detailed transactional records related to electronics sales. Each row in the dataset represents an individual sales transaction.

The dataset includes the following key columns:

- **Date:** The date on which the transaction occurred
- **Product:** Name of the electronic product sold
- **Category:** Type of product such as Mobile, Laptop, Accessories, etc.
- **Sales Representative:** Employee responsible for the sale
- **City:** Location where the sale was made
- **Units Sold:** Number of units sold in a transaction
- **Unit Price:** Price per unit of the product
- **Total Amount:** Total value of the transaction

3. DATA CLEANING AND PREPARATION

Data cleaning is one of the most important steps in any data analysis project. Incorrect or inconsistent data can lead to misleading insights. The following steps were performed during data cleaning:

- Removal of duplicate records
- Verification of numerical values such as units sold and prices
- Correction of inconsistent category and city names
- Formatting of date columns
- Rearranging columns for better readability
- Validation of calculated fields like total amount

After cleaning, the data became structured, consistent, and ready for further analysis.

4. PIVOT TABLES AND PIVOT CHARTS

Pivot Tables were created from the cleaned dataset to summarize large amounts of sales data efficiently. Pivot tables help in grouping, filtering, and aggregating data dynamically.

The following pivot tables were created:

- Category-wise sales summary
- City-wise total sales
- Product-wise revenue analysis
- Sales representative performance analysis

- Date-wise and monthly sales trends

Pivot Charts were generated using these pivot tables to represent data visually. These charts helped in identifying trends, comparisons, and patterns easily. Pivot tables and pivot charts form the backbone of the dashboard.

5. DASHBOARD DESIGN AND KPIS

The dashboard is designed to present all important information on a single screen. Proper alignment, color consistency, and labeling were maintained to ensure clarity and ease of use.

Key Performance Indicators (KPIs) included in the dashboard are:

- **Total Sales Amount**
- **Total Units Sold**
- **Top-Selling Product**
- **Best Performing City**
- **Best Performing Sales Representative**

The dashboard also includes bar charts, line charts, and pie charts for visual comparison. Filters and slicers are provided so users can interact with the dashboard and view specific insights instantly.

Figure: Electronics Sales Dashboard created using Microsoft Excel

6. INSIGHTS AND ANALYSIS

Based on the dashboard analysis, the following insights were observed:

- Certain product categories contribute significantly more revenue than others
- Sales performance varies across different cities
- Some sales representatives consistently perform better
- Sales trends show variations across different time periods
- High unit sales do not always result in high revenue due to pricing differences

These insights help organizations understand customer demand, regional performance, and sales effectiveness.

7. TOOLS USED

The following tools and features were used to complete this project:

- Microsoft Excel for data analysis and dashboard creation
- Raw data tables for data storage
- Data cleaning techniques
- Pivot Tables and Pivot Charts
- Filters and slicers for interactive analysis

8. CONCLUSION

The **Electronics Sales Dashboard** successfully converts raw sales data into meaningful and actionable insights. This project demonstrates the effective use of Microsoft Excel for data analysis, visualization, and reporting.

The dashboard enables quick understanding of sales performance, product trends, and regional contributions. Overall, this project improved my analytical thinking and strengthened my practical understanding of Excel dashboards.
